	S	UPERVISORY PATENT	

U.S. Patent and Trademark Office PTOL-303 (Rev. 7-05) Note 3: The proposed amended claims require further consideration and/or search, because amended claim 19 to read in part, "wherein the optical recording medium includes a wobble signal, and the recording waveform generating unit detects the information data from the wobble signal". Such limitation was not previously presented.

Note 11: Applicant's arguments with respect to claims 1-5, 7-12, 14-16, 18, 20, 21 and 25-29 under 35 U.S.C 103(a) in view Dekker and Ichihara have been fully considered but they are not persuasive. Specifically, Applicant aruges that niether Ichihara nor Dekker suggest altering the overall erasure pattern or reverse the power levels in the manner required to meet the features of claim 1. However, Examiner respectfully disagrees. Ichihara does suggest modifying the power level between an end of the second multi-pulse and a first one of the pulses of the first multi-pulse (see col. 6, lines 62 to col. 7, line 5), so that level may be changed from Pc1 to Pa, Pc2 to Pa, or to Pa after once returning it to the conventionally used Pc level. The portion of the pulse having the Pc level shown in Fig. 1B is between the end of the second pulses and a first one of the pulses of the first multi-pulse. Since, Dekker shows that leading pulse of the erase pattern is a low level pulse (see Fig. 1A; the pulse between write pulses 13 and erase pulses 14 corresponds to a low level pulse), it would have been obvious to one of ordinary skill in the art to combine the teaching of Dekker and Ichihara, because Ichihara suggests the modification of the power level between the end of the second multi-pulse and a first one of the pulses of the first multi-pulse to best meet the thermal response of the recording medium. Furthermore, Applicant points out that Examiner has not accounted for evidence of record which shows an improvement in jitter performance where erasure pulses having a first pulse at a low level and pulse between erase and recording pattern at a high level, and further states that such evidence is included in Figs. 14A and 19A of the instant application. However, Fig. 19A of Applicant's disclosure does not show an improvement in jitter performance for option LH, rather it shows that among the four options of the erase pattern arrangement, option LH has the highest jitter. Accordingly, claims 1-29 are not patentable. The application is not in condition for allowance.
